

## AOI BLACKBOARD MFG. CO., LTD

Japan, 2008

Presentation Equipment

### ■ Background to the introduction

Until now, the projectors that Aoi Blackboard have used for presentations with its interactive whiteboard system have been ceiling mounted or desktop types. As a result of its initiatives to improve functionality and ease of use, the company has introduced Hitachi's new Ultra-Short Throw LCD Projector, which allows integration of the board and projector.

### ■ Benefits of the introduction

The setup distance of this projector is a little less than 20cm/8" from the 77" Interactive whiteboard. It can project an image covering the entire board from this distance, permitting a reduction in the length of the arm used to attach the projector. Because it is compact and lightweight, weighing only 5.8kg/12.8 lbs., there are no worries about the strength of the arm. Furthermore, it is possible to slide the board and projector after they have been set up. It is not necessary to position the projector.

Another convenient feature is the ability to raise and lower the board for each image that is projected to suit the height of the presenter. And since the system can slide to the left and right, it ensures adequate space for presentations accompanied by projection of images, and can be fixed in a position where it is easy to see. Finally, because the images are projected from near the board, the presenter's shadow, and even the shadow of the presenter's hand while writing on the board, are barely seen on the board, ensuring that the audience has a clear view.
